

AUTOMATED EVENT CREATION

ABSTRACT

Systems and methods that implement automated event creation for use in storing files relating to an event that is to occur at a predetermined time in the future. An exemplary system comprises a computer device, a peripheral device, and software, or folder creation apparatus, that creates a folder on the peripheral device when it is

5 connected to the computer device into which files that are created on the peripheral device are automatically placed. One exemplary method accepts an event on a computer device, connects a peripheral device to the computer device, creates a folder for the event on the connected a peripheral device, and after the predetermined time, automatically

10 places files that are created on the peripheral device into the folder. Another exemplary method configures a computer device to allow a peripheral device to connect to it, at the time of the event, connects the peripheral device to the personal computer, and upon connection, creates a folder on the connected peripheral device, into which files that are created on the peripheral device are automatically placed.
